Ray core

Ray Project

The image is a screenshot of a video player interface. At the top left is the Ray Summit logo with the text "Presented by Anyscale". At the top right is the date "September 30–October 1". On the left side of the video frame, there is a video thumbnail showing a young man speaking. The main video area has a white background with the title "Ecosystem" in large bold letters. Below it, the video is divided into two sections: "Native Libraries" and "Third Party Libraries", each containing logos for various projects. A large black banner at the bottom of the video area contains the text "Ray becoming the go-to framework for scaling libraries". The video player includes standard controls like play, volume, and a progress bar at the bottom.

Keynote: The Future of Ray - Robert Nishihara, Anyscale

Ray Project

A kind of **pattern language** for distributed systems,
as a library in Python, Java, C++ (upcoming):

- **task-parallel** – stateless, data independence
- **remote objects** – key/value store
- **actor pattern** – messages among classes,
managing state
- **parallel iterators** – lazy, infinite sequences
- **multiprocessing.Pool** – drop-in replacement
- **joblib** – e.g., *scikit-learn* back-end
- Dask, Modin, Mars, etc.

Mix and match as needed, without tight coupling
to framework

Closures and Decorators

Ray makes use of *closures* and *decorators* in Python:

- [**"Closures and Decorators in Python"**](#)
- [**PEP 318**](#)
- [**asyncio**](#)

See also:

- [**"Ray Design Patterns"** \(WIP\)](#)
- [**patterns.eecs.berkeley.edu**](#)

Pattern: task-parallel

Remote Functions:

- a `@ray.remote` decorator on a function
- properties: *data independence, stateless*
- patterns: **Task Parallelism, Task Graph**

reference:

Patterns for Parallel Programming

Timothy G. Mattson, Beverly A. Sanders, Berna L. Massingill
Addison-Wesley (2004)

Pattern: task-parallel

However, by adding the `@ray.remote` decorator, a regular Python function becomes a Ray remote function:

```
@ray.remote  
def my_function():  
    return 1
```

To invoke this remote function, use the `remote` method. This will immediately return an object ref (a *future* in Python) and then create a task that will be executed on a worker process.

```
obj_ref = my_function.remote()  
obj_ref
```

```
ObjectRef(df5a1a828c9685d3fffffffff0100000001000000)
```

The result can be retrieved with `ray.get`

```
ray.get(obj_ref)
```

Pattern: task-parallel

Tutorials:

[colab.research.google.com/github/ray-project/tutorial/
blob/master/exercises/colab01-03.ipynb](https://colab.research.google.com/github/ray-project/tutorial/blob/master/exercises/colab01-03.ipynb)

[github.com/ansyscale/academy/blob/master/ray-crash-
course/01-Ray-Tasks.ipynb](https://github.com/ansyscale/academy/blob/master/ray-crash-course/01-Ray-Tasks.ipynb)

Pattern: distributed object store

Remote Objects:

- shared-memory object store
- roughly, akin to parts of **Redis**
- “lives somewhere on the cluster”

reference:

https://en.wikipedia.org/wiki/Shared_memory

Pattern: distributed object store

To start, we'll put an object into the Ray object store...

```
y = 1  
obj_ref = ray.put(y)
```

Then get the value of this object reference

```
ray.get(obj_ref)
```

1

You can also access the values of multiple object references in parallel:

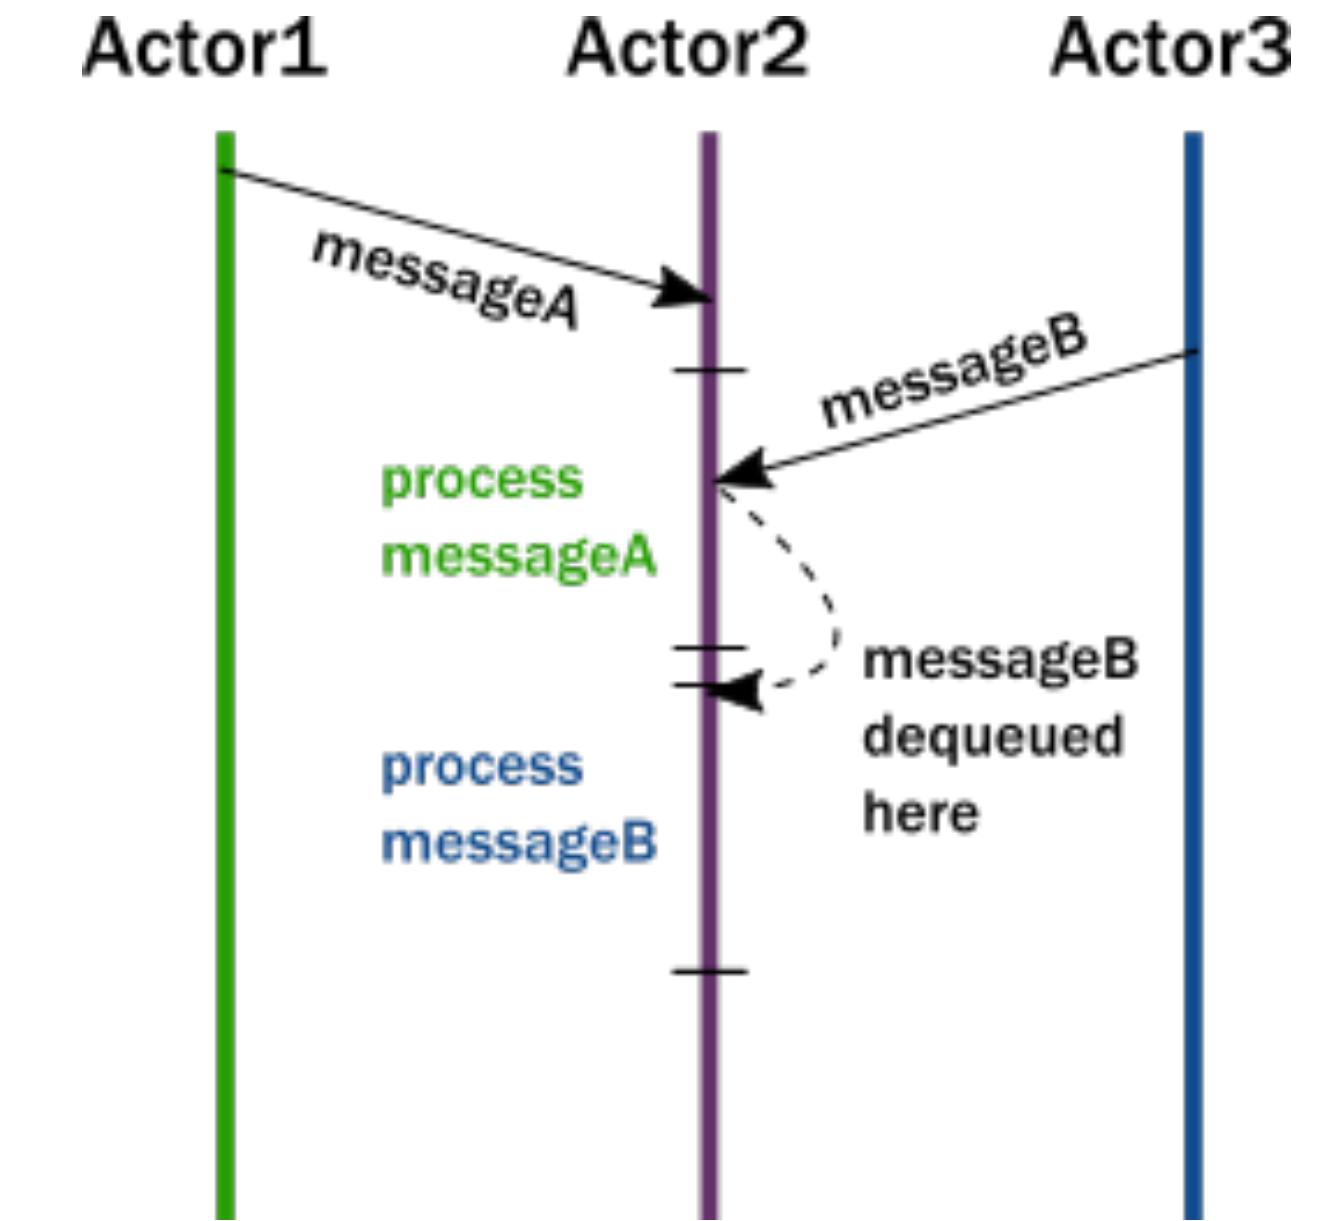

```
ray.get([ray.put(i) for i in range(3)])
```

[0, 1, 2]

Pattern: actors

Remote Classes:

- a `@ray.remote` decorator on a class
- properties: *stateful, message-passing semantics*
- pattern: **Actors**
- “lives somewhere on the cluster”

reference:

“A Universal Modular Actor Formalism for Artificial Intelligence”

Carl Hewitt, Peter Bishop, Richard Steiger

IJCAI (1973)

open: <https://www.ijcai.org/Proceedings/73/Papers/027B.pdf>

Pattern: actors

To start, we'll define a class and use the decorator:

```
@ray.remote
class Counter(object):
    def __init__(self):
        self.value = 0

    def increment(self):
        self.value += 1
        return self.value
```

Now use this class `Counter` to create an actor:

```
counter = Counter.remote()
```

Then call the actor:

```
obj_ref = counter.increment.remote()
ray.get(obj_ref)
```

Pattern: actors

Tutorials:

[colab.research.google.com/github/ray-project/tutorial/
blob/master/exercises/colab04-05.ipynb](https://colab.research.google.com/github/ray-project/tutorial/blob/master/exercises/colab04-05.ipynb)

[github.com/anyscale/academy/blob/master/ray-crash-
course/02-Ray-Actors.ipynb](https://github.com/anyscale/academy/blob/master/ray-crash-course/02-Ray-Actors.ipynb)

Pattern: distributed multiprocessing pool

Distributed multiprocessing.Pool:

- make Python programs distributed, using actors
- easy to scale existing applications that use `multiprocessing.Pool`

```
from ray.util.multiprocessing import Pool

def f(index):
    return index

pool = Pool()
for result in pool.map(f, range(100)):
    print(result)
```

Tutorial:

github.com/anscale/academy/blob/master/ray-crash-course/04-Ray-Multiprocessing.ipynb

Pattern: joblib

Distributed scikit-learn:

- drop-in replacement to parallelize
JobLib (scikit-learn backend)

Tutorial:

github.com/ansyscale/academy/blob/master/ray-crash-course/04-Ray-Multiprocessing.ipynb

Pattern: joblib

```
import numpy as np
from sklearn.datasets import load_digits
from sklearn.model_selection import RandomizedSearchCV
from sklearn.svm import SVC

digits = load_digits()
param_space = {
    'C': np.logspace(-6, 6, 30),
    'gamma': np.logspace(-8, 8, 30),
    'tol': np.logspace(-4, -1, 30),
    'class_weight': [None, 'balanced'],
}

model = SVC(kernel='rbf')
search = RandomizedSearchCV(model, param_space, cv=5, n_iter=300, verbose=10)

import joblib
from ray.util.joblib import register_ray

register_ray()
with joblib.parallel_backend('ray'):
    search.fit(digits.data, digits.target)
```

Pattern: sharded, lazy iterators

Parallel Iterators:

- API for simple data ingest and processing
- fully serializable
- can operate over infinite sequences of items
- transformations based on method chaining
- passed to remote tasks and actors to represent data shards

Tutorial:

github.com/anyscale/academy/blob/master/ray-crash-course/05-Ray-Parallel-Iterators.ipynb

Pattern: sharded, lazy iterators

```
import ray
import numpy as np

ray.init()

@ray.remote
def train(data_shard):
    for batch in data_shard:
        print("train on", batch) # perform model update with batch

it = (
    ray.util.iter.from_range(1000000, num_shards=4, repeat=True)
    .batch(1024)
    .for_each(np.array)
)

work = [train.remote(shard) for shard in it.shards()]
ray.get(work)
```

part 2: “A Berkeley View”

Formal definition of Cloud Computing

Professors **Ion Stoica** and **David Patterson** led EECS grad students to define cloud computing **formally** in 2009

“More than 17,000 citations to this paper...”

2019 follow-up:

“We now predict ... that *Serverless Computing* will grow to dominate the future of cloud computing in the next decade”

The screenshot shows the Ariselab website header with the logo and navigation links: HOME, PEOPLE, PROJECTS, PUBLICATIONS, SPONSORS, DARE, ACADEMICS, NEWS, EVENTS, RISE CAMP, BLOGS, JENKINS. The main content area features the title "Cloud Programming Simplified: A Berkeley View on Serverless Computing" by David Patterson and Ion Stoica, published on FEBRUARY 10, 2019. Below the title is a short bio and a link to "Above the Clouds: A Berkeley View of Cloud Computing".

Cloud Programming Simplified: A Berkeley View on Serverless Computing

ION STOICA / FEBRUARY 10, 2019 /

David Patterson and Ion Stoica

The publication of “Above the Clouds: A Berkeley View of Cloud Computing” on February 10, 2009 cleared up the considerable confusion about the new notion of “Cloud Computing.” The paper defined what Cloud Computing was, where it came from, why some were excited by it, what were its technical advantages, and what were the obstacles and research opportunities for it to become even more popular. More than 17,000 citations to this paper and an [abridged version](#) in *CACM*—with more than 1000 in the past year—document that it continues to shape the discussions and the evolution of Cloud Computing.

Evolution of cloud patterns

Initially, cloud services were simplified to make them more recognizable for IT staff accustomed to VMware

- Patterson, et al., developed industry research methodology and eventually also a **pattern language** to describe distributed systems
- **AMPLab** foresaw how cloud use cases would progress in industry over the next decade, which greatly informed **Apache Spark**, etc.

February 10, 2009

Evolution of cloud patterns

Eric Jonas noted >50% of **RISElab** grad students had never used Spark, plus how cloud was evolving in its second decade:

- “Decoupling of computation and storage; they scale separately and are priced independently”
- “The abstraction of executing a piece of code instead of allocating resources on which to execute that code”
- “Paying for the code execution instead of paying for resources you have allocated toward executing the code”

February 10, 2019

Hardware > Software > Process

Circa 2005: commodity hardware served Big Data needs: **log file analysis** using **task-parallel**

Circa 2009: data science workloads introduced stateful **actor pattern** through Spark, Akka, etc.

Circa 2013: deep learning placed more demands on s/w + h/w, **differentiating gradients within the context of networked data**

Examples in notebooks...

The screenshot shows a GitHub repository page for 'README.md'. The title 'A Guided Tour of Ray Core' is displayed prominently. Below the title, there is a brief description: 'An introductory tutorial about leveraging Ray core features for distributed patterns.' A note follows: 'Note: these examples have been tested using Python 3.7+ on:' followed by a bulleted list: '• Ubuntu 18.04 LTS' and '• macOS 10.13'. A 'Getting Started' section is present with instructions: 'To get started use `git` to clone this public repository:' and a code block containing the command: `git clone https://github.com/DerwenAI/ray_tutorial.git` and `cd ray_tutorial`.

README.md

A Guided Tour of Ray Core

An introductory tutorial about leveraging Ray core features for distributed patterns.

Note: these examples have been tested using Python 3.7+ on:

- Ubuntu 18.04 LTS
- macOS 10.13

Getting Started

To get started use `git` to clone this public repository:

```
git clone https://github.com/DerwenAI/ray_tutorial.git  
cd ray_tutorial
```

https://github.com/DerwenAI/ray_tutorial

A tour through “Ray Design Patterns”

The screenshot shows a Google Docs interface with the following details:

- Title:** Ray Design Patterns
- Toolbar:** Includes File, Edit, View, Insert, Format, Tools, Add-ons, Help, and various document icons.
- Header:** Ray Design Patterns
- Image:** A row of colorful animal icons (cat, bear, dog, panda, zebra, duck).
- Left Sidebar:** A navigation tree:

- Content Area:**
 - ## Ray Design Patterns

Created: November 2020

★ This is a community maintained document; suggested edits and comments are welcome!

This document is a collection of common design patterns (and anti-patterns) for Ray programs. It is meant as a handbook for both:

 - New users trying to understand how to get started with Ray, and
 - Advanced users trying to optimize their Ray applications

This document is not meant as an introduction to Ray. For that and any further questions that arise from this document, please refer to [A Gentle Introduction to Ray](#), the [Ray GitHub](#), and the [Ray Slack](#). Highly technical users may also want to refer to the [Ray 1.0 Architecture whitepaper](#).

The patterns below are organized into "Basic Patterns," which are commonly seen in Ray applications, and "Advanced Patterns," which are less common but may be invaluable for certain use cases.

★ This is a community maintained document; suggested edits and comments are welcome! 1

Gradient Flow

Data, Machine Learning, and AI

Newsletter Podcast Blog Reports Video Events

Towards an infinite laptop

The new Anyscale platform offers the ease of development on a laptop combined with the power of the cloud.

During a series of short keynotes at the [Ray Summit](#) this morning, Anyscale¹, the company formed by the creators of Ray, publicly shared their initial product offering.

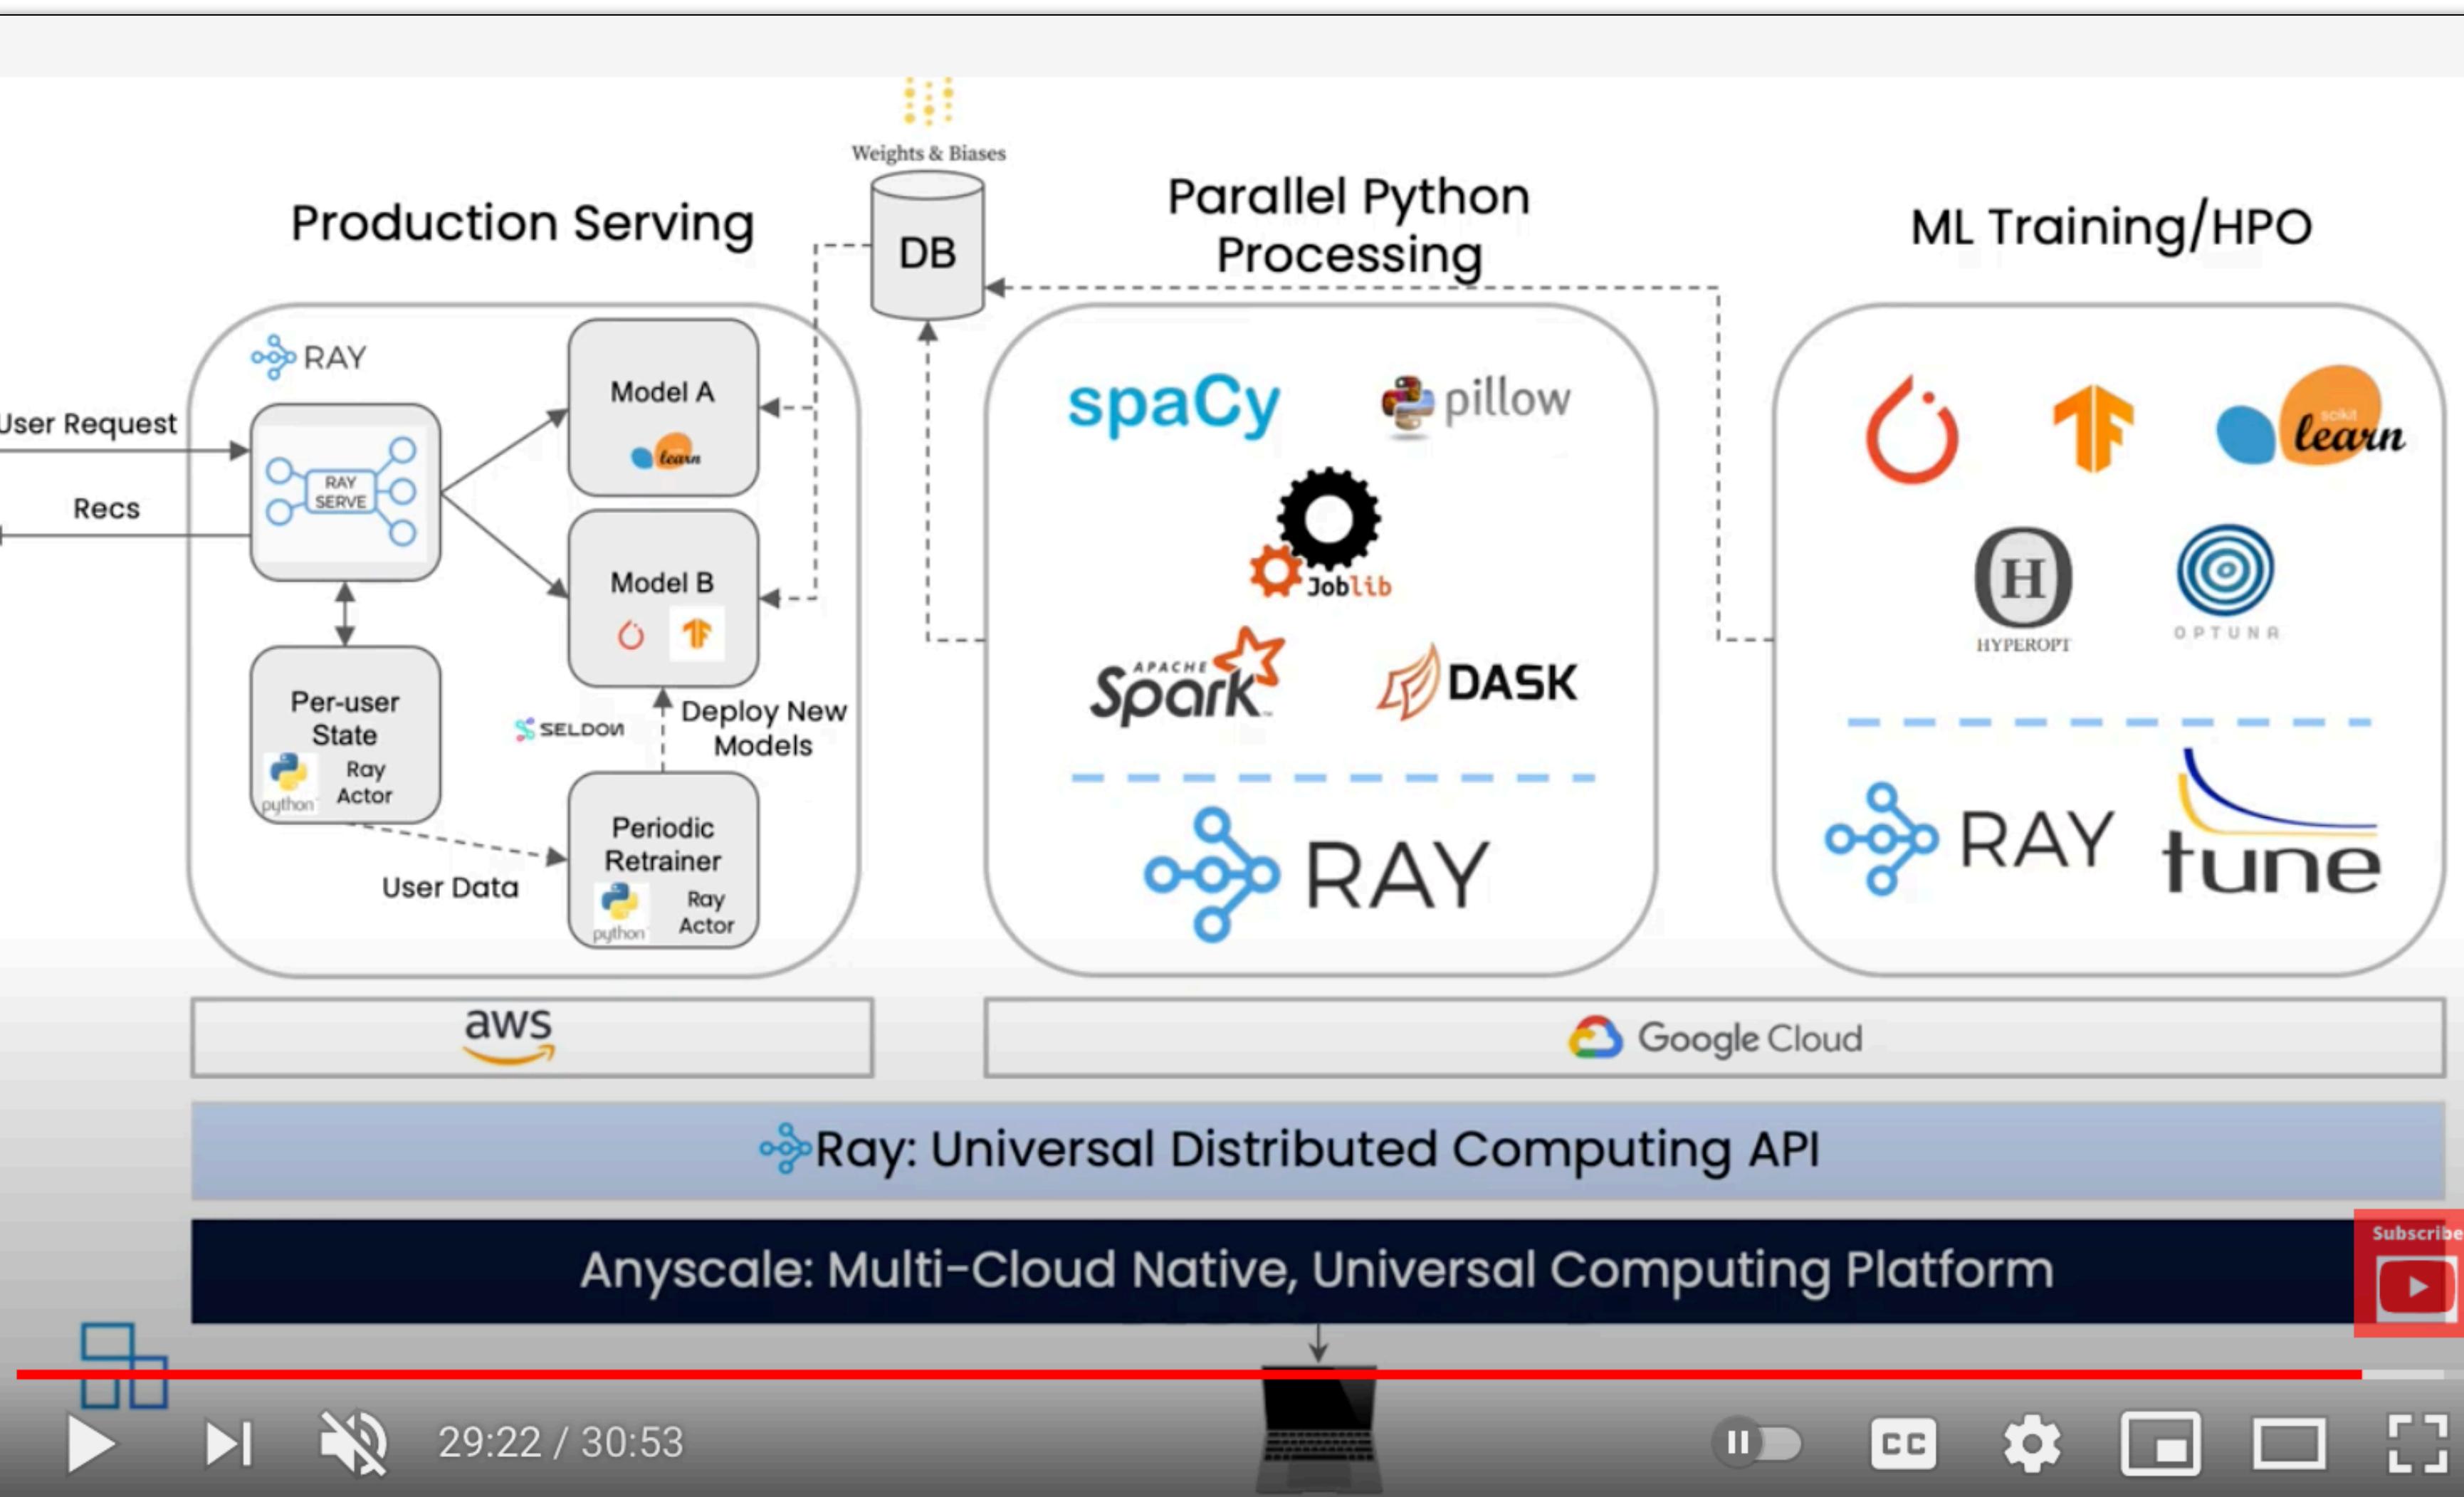

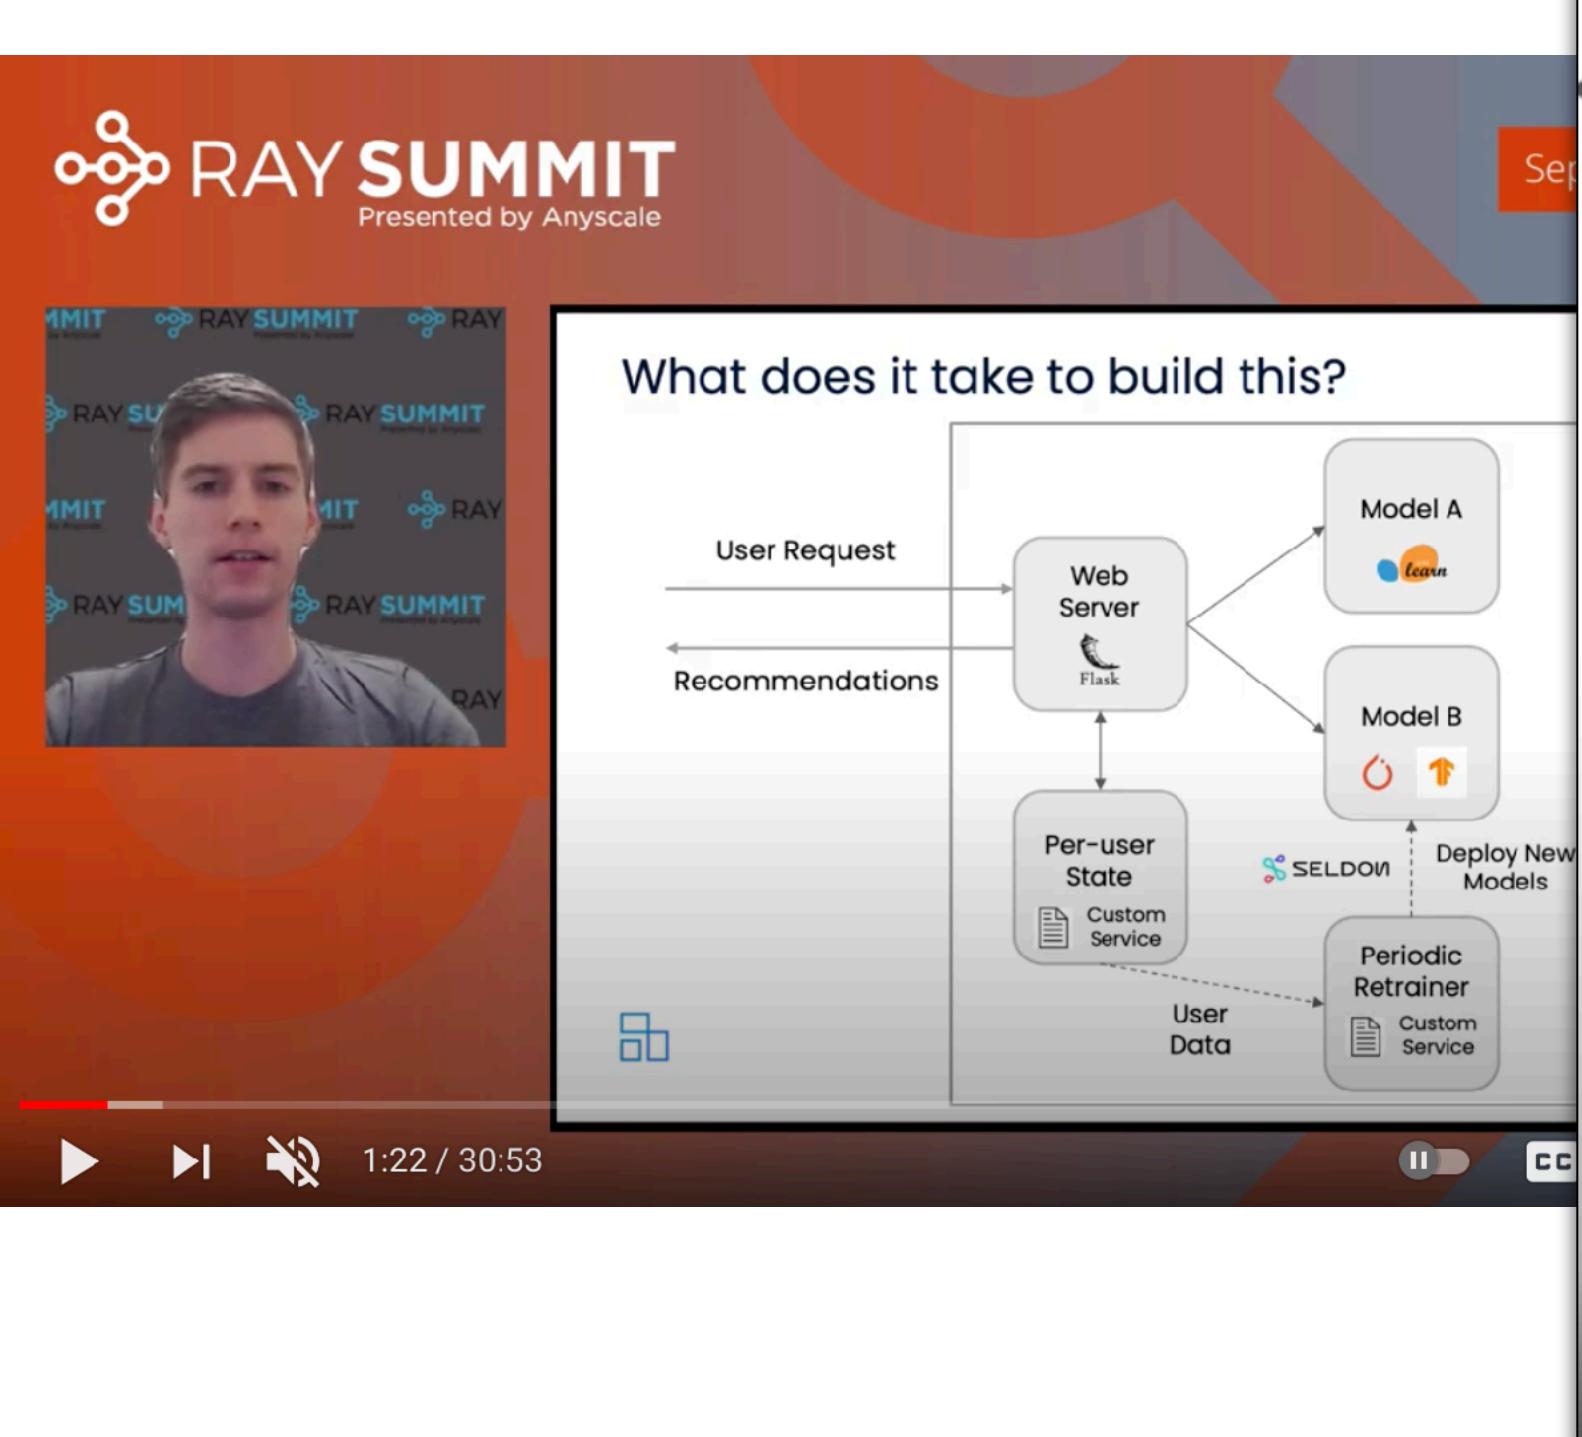

Dubbed the “infinite laptop”, Anyscale’s platform allows developers to treat their laptop as an “infinite cluster”.

Developers can use their preferred development tools (e.g., IDE, notebook, text editor, etc.) on Anyscale’s platform, and seamlessly burst into a cloud platform when needed.
